METHODOLOGY

From Public ED Data To Southlake Future-State Planning Scenarios

Agentic synthetic data workflow for distributed-health-network planning questions.

Core Message

We turn safe public ED data into synthetic planning artifacts for Southlake's distributed-health-network questions, then make the limitations visible. Reasoning supported by TheFinlyApp — an agentic intelligence platform adapted for healthcare planning.

Input

Curated public ED dataset used as a safe planning stand-in.

Agent Flow

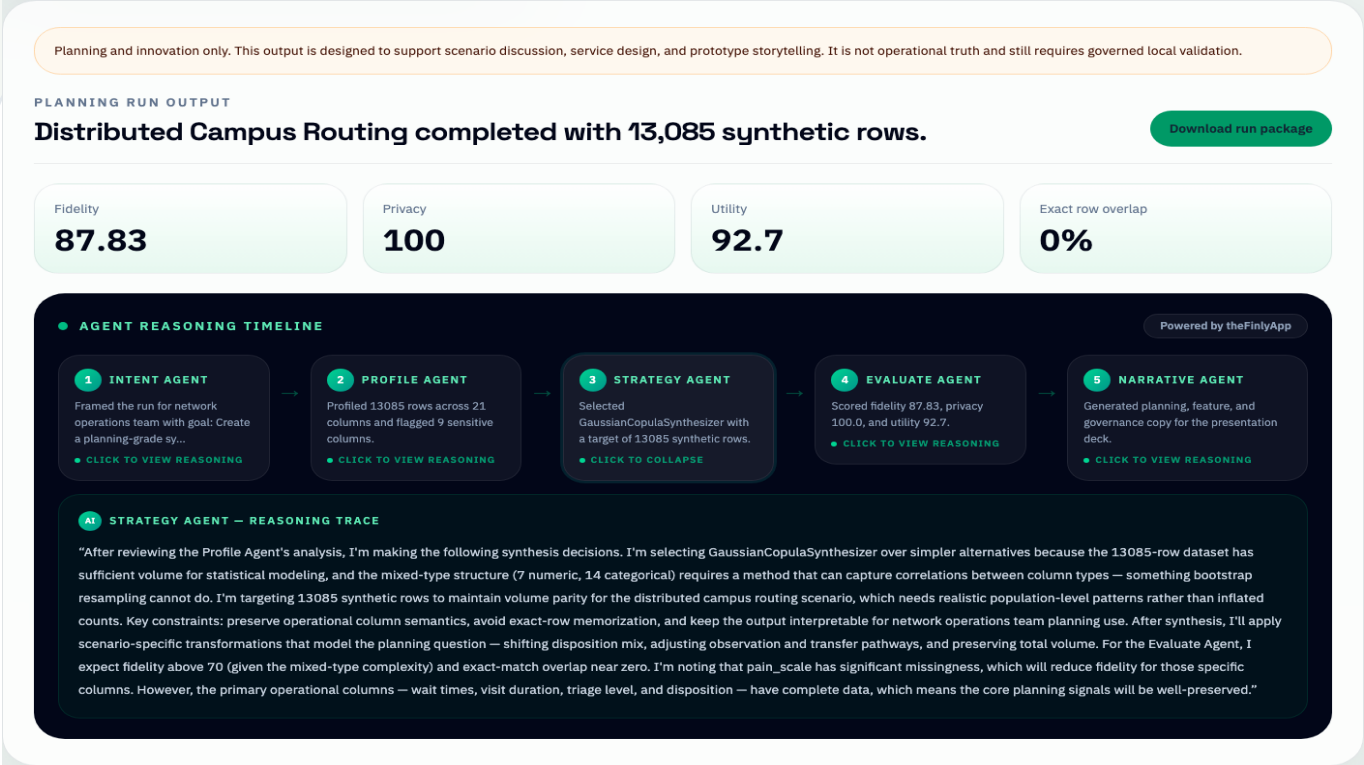
Goal framing -> profile -> plan -> generate -> evaluate -> caution report.

Southlake Lens

Distributed campus routing, community diversion, growth, and surge scenarios.

Outputs

Synthetic dataset, metrics dashboard, caution summary, export ZIP, pitch artifacts.

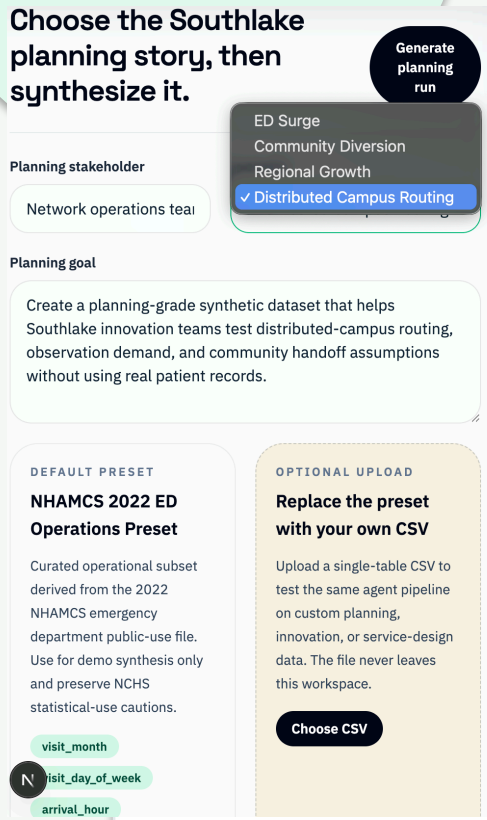


Planning questions: campus routing | observation demand | transfer pathways | closer-to-home care

Message for judges: the product is not only about generating rows; it is about making synthetic planning data usable and governed.

What The Studio Actually Does

Visible evaluation, synthetic data output, and exportable artifacts — the studio shows its work at every step.



NUMERIC COLUMNS

arrival_hour, wait_time_minutes, length_of_visit_minutes, age_years, pain_scale, chronic_conditions_count, observation_minutes

Preset preview

visit month	visit day of week	arrival hour	wait time minutes	length of visit minutes	age years	sex	race ethnicity	arrived by ambulance	transfer in	triage level
September	Monday	6	10	228	23	Female	Non-Hispanic White	No	Not applicable	Urger
September	Monday	10	40	319	15	Male	Non-Hispanic Other	Unknown	Unknown	Unkn
September	Monday	14	70	551	19	Male	Hispanic	No	Not applicable	Urger
September	Monday	22	14	168	18	Female	Non-Hispanic White	No	Not applicable	U
September	Tuesday	9	2	113	39	Male	Non-Hispanic White	No	Not applicable	U

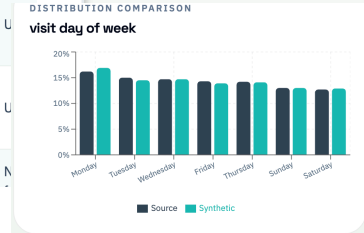
Feature Highlights

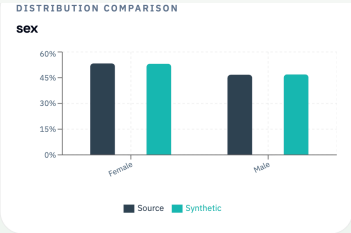
Per-column fidelity scoring — numeric and categorical columns evaluated separately with clear visual breakdown

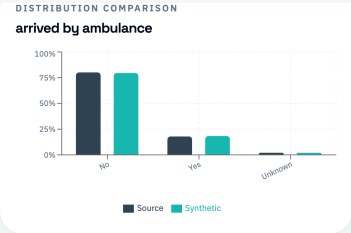
Source-vs-synthetic distribution charts show how well the generated data preserves real ED patterns

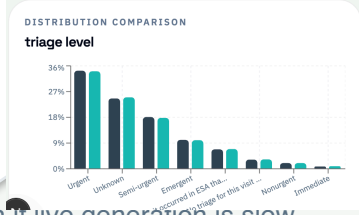
Side-by-side data preview lets planners compare source and synthetic rows directly

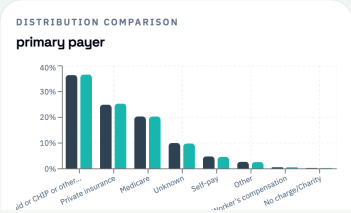
Exportable evaluation package — synthetic dataset, metrics, caution report, and pitch artifacts in one ZIP

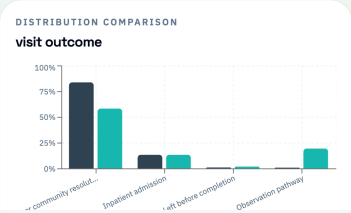












Pitch note: judges can see both the data product and the explanation product, with a reliable saved-run path if live generation is slow.

What The Studio Is Safe For, And What It Is Not

Synthetic data is useful for planning and experimentation, but it is not local operational truth.

Good For

Planning, innovation, and prototyping conversations

Scenario workshops about distributed-campus routing and community diversion

Testing dashboards, workflows, and early-stage analytics without real patient records

Pitch-day storytelling backed by metrics, cautions, and exportable artifacts

Not Ready For

Clinical care, staffing commitments, reimbursement, or patient-level action

Claims about Southlake's real patient mix or operational truth from a U.S. public-use source

A full hospital digital twin or a validated multi-table operational model

Production use without governance, privacy review, and validation on governed local data

Best next step: validate the workflow with governed Southlake data, operational owners, and formal privacy review.

Credibility note: this caution slide is a strength. It shows the team understands healthcare risk and is not overselling the prototype.
