METHODOLOGY

# From Public ED Data To Southlake Future-State Planning Scenarios

Agentic synthetic data workflow for distributed-health-network planning questions.

## Core Message

**We turn safe public ED data into synthetic planning artifacts for Southlake's distributed-health-network questions, then make the limitations visible. Reasoning supported by TheFinlyApp — an agentic intelligence platform adapted for healthcare planning.**

### Input

Curated public ED dataset used as a safe planning stand-in.

### Agent Flow

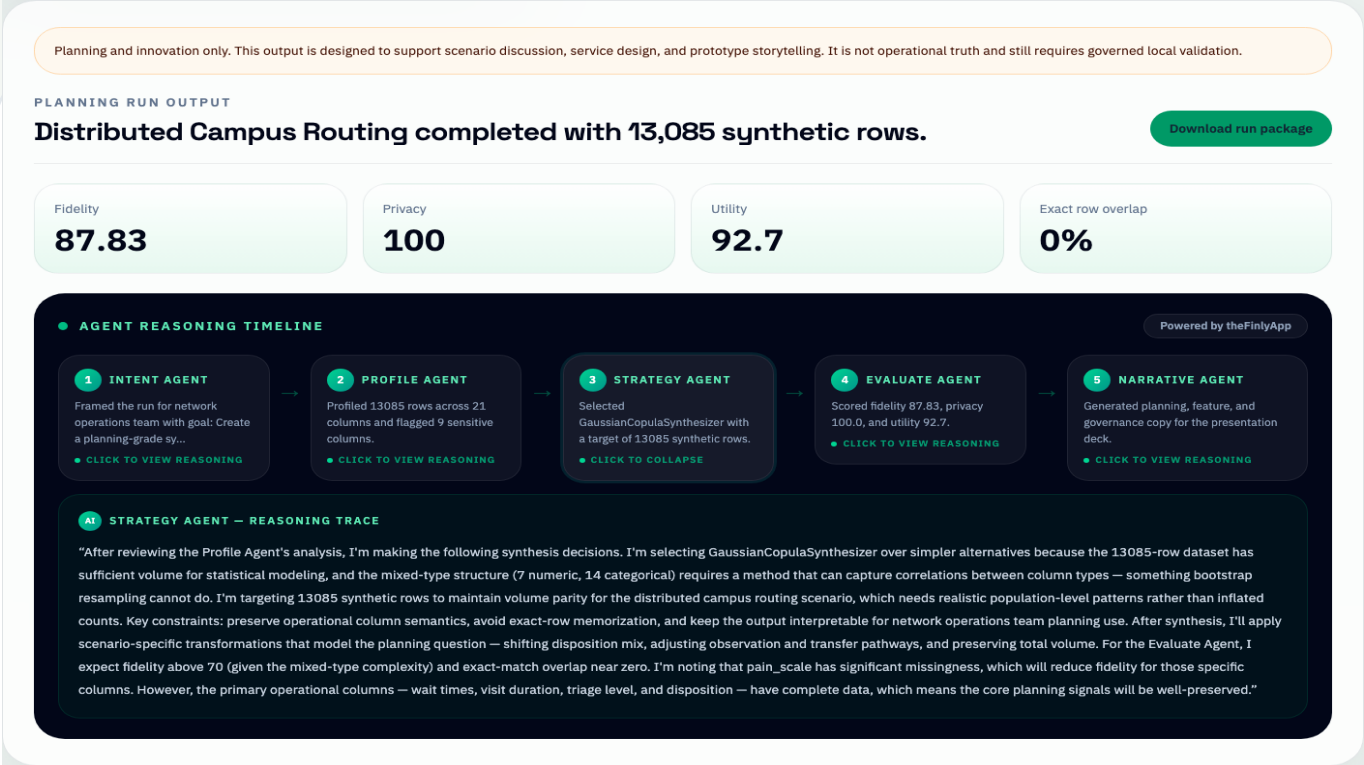
Goal framing -> profile -> plan -> generate -> evaluate -> caution report.

### Southlake Lens

Distributed campus routing, community diversion, growth, and surge scenarios.

### Outputs

Synthetic dataset, metrics dashboard, caution summary, export ZIP, pitch artifacts.



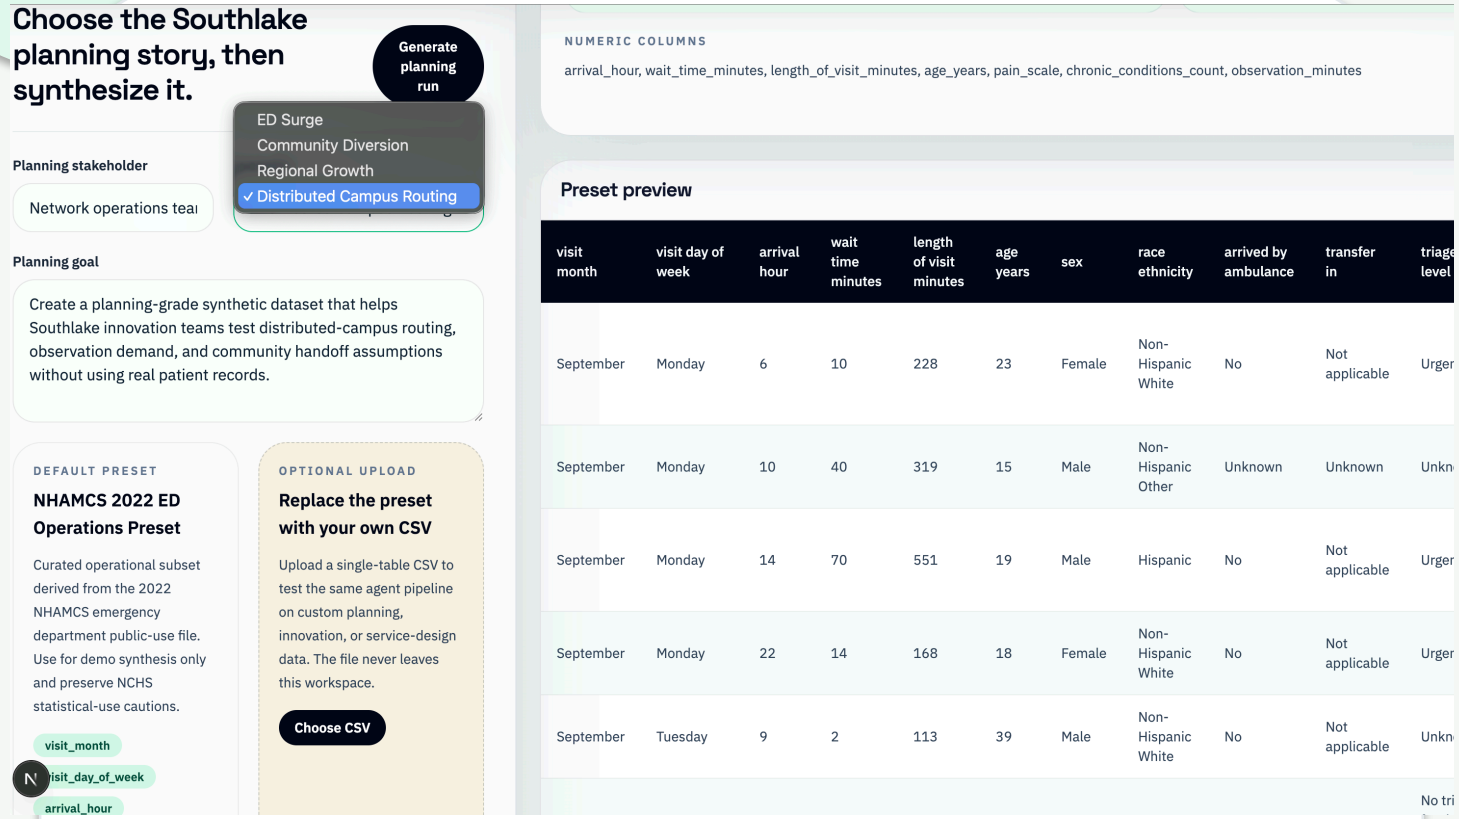
**Planning questions: campus routing | observation demand | transfer pathways | closer-to-home care**

Message for judges: the product is not only about generating rows; it is about making synthetic planning data usable and governed.

FEATURES

# What The Studio Actually Does

Visible evaluation, synthetic data output, and exportable artifacts — the studio shows its work at every step.



## Feature Highlights

- Per-column fidelity scoring — numeric and categorical columns evaluated separately with clear visual breakdown
- Source-vs-synthetic distribution charts show how well the generated data preserves real ED patterns
- Side-by-side data preview lets planners compare source and synthetic rows directly
- Exportable evaluation package — synthetic dataset, metrics, caution report, and pitch artifacts in one ZIP

**Primary saved run**

**Distributed Campus Routing I run f24271e772**

Fidelity 87.8 Privacy 100.0 Utility 92.7

Pitch note: judges can see both the data product and the explanation product, with a reliable saved-run path if live generation is slow.

# What The Studio Is Safe For, And What It Is Not

Synthetic data is useful for planning and experimentation, but it is not local operational truth.

## Good For

Planning, innovation, and prototyping conversations

Scenario workshops about distributed-campus routing and community diversion

Testing dashboards, workflows, and early-stage analytics without real patient records

Pitch-day storytelling backed by metrics, cautions, and exportable artifacts

## Not Ready For

Clinical care, staffing commitments, reimbursement, or patient-level action

Claims about Southlake's real patient mix or operational truth from a U.S. public-use source

A full hospital digital twin or a validated multi-table operational model

Production use without governance, privacy review, and validation on governed local data

**Best next step: validate the workflow with governed Southlake data, operational owners, and formal privacy review.**

Credibility note: this caution slide is a strength. It shows the team understands healthcare risk and is not overselling the prototype.
