METHODOLOGY

From Public ED Data To Southlake Future-State Planning Scenarios

Agentic synthetic data workflow for distributed-health-network planning questions

Core Message

We turn safe public ED data into synthetic planning artifacts for Southlake's distributed-health-network questions, then make the limitations visible before anyone over-trusts the output.

Input

Curated public ED dataset used as a safe planning stand-in.

Agent Flow

Goal framing -> profile -> plan -> generate -> evaluate -> caution report.

Southlake Lens

Distributed campus routing, community diversion, growth, and surge scenarios.

Outputs

Synthetic dataset, metrics dashboard, caution summary, export ZIP, pitch artifacts.

Planning questions: campus routing I observation demand I transfer pathways I closer-to-home care

Message for judges: the product is not only about generating rows; it is about making synthetic planning data usable and governed.

FEATURES

What The Studio Actually Does

Saved demo reliability, visible evaluation, and exportable artifacts for innovation teams.

Saved demo run

Scenario controls

PLANNING EVALUATION

Distributed Campus Routing scenario generated 13085 synthetic rows from 13085 source rows.

Numeric similarity averaged 68.6 and categorical similarity averaged 97.4.

Output preserves a readable planning-and-innovation schema for workshop, demo, and slide use.

PITCH-READY BRIEFING OUTPUT

Methodology

Loaded a curated NHAMCS emergency dataset and profiled its operational schema for network operations team planning work.

Features

Single-click preset loading, upload support, and agent-style planning runs for Southlake-style service desig

Synth

Cautions

Use synthetic outputs for planning workshops, innovation sprints, workflow prototyping, and scenario

ataset as

Pitch + cautions

Feature Highlights

Southlake-specific scenarios aligned to distributed-network planning needs

One-click saved demo runs plus optional fresh synthesis or CSV upload

Visible fidelity, privacy, and utility metrics in one screen

Auto-generated methodology, features, and cautions for pitch preparation

Primary saved run

Distributed Campus Routing I run 72c9c81912

Fidelity 81.54 Privacy 100.0 Utility 88.92

Pitch note: judges can see both the data product and the explanation product, with a reliable saved-run path if live generation is slow.

What The Studio Is Safe For, And What It Is Not

Synthetic data is useful for planning and experimentation, but it is not local operational truth.

Good For

Planning, innovation, and prototyping conversations

Scenario workshops about distributed-campus routing and community diversion

Testing dashboards, workflows, and early-stage analytics without real patient records

Pitch-day storytelling backed by metrics, cautions, and exportable artifacts

Not Ready For

Clinical care, staffing commitments, reimbursement, or patient-level action

Claims about Southlake's real patient mix or operational truth from a U.S. public-use source

A full hospital digital twin or a validated multi-table operational model

Production use without governance, privacy review, and validation on governed local data

Best next step: validate the workflow with governed Southlake data, operational owners, and formal privacy review.

Credibility note: this caution slide is a strength. It shows the team understands healthcare risk and is not overselling the prototype.
